<sup>2</sup>University of Tartu, Estonia

UNIVERSITY OF TARTU  
Department of Botany

NEW FRONTIERS IN RESTORATION

# NEED OF GREEN INFRASTRUCTURE

- In the last century the degradation of natural ecosystems became very dramatic
  - ▣ Land use changes
  - ▣ Agricultural intensification
  - ▣ Urbanisation
  - ▣ Climate change
- The formerly dominant static and habitat-based conservation paradigm cannot be held

# NEED OF GREEN INFRASTRUCTURE

- Green infrastructure is a **strategically planned network of natural and semi-natural areas** with other environmental features designed and managed **to deliver a wide range of ecosystem services** such as water purification, air quality, space for recreation and climate mitigation and adaptation.
- This **network of green (land) and blue (water) spaces** can improve environmental conditions and therefore citizens' health and quality of life.

# CONSERVATION AND RESTORATION

- Key element of developing green infrastructure is to apply in conservation and restoration a new paradigm, which is
  - Holistic
  - Focus on the conservation and restoration of processes and functions and not exclusively on composition
  - Focus on sustainability
  - Consider also landscape-scale processes

# NEED OF THEORY

- It is necessary to have strong theoretical basis of conservation and restoration actions.
- Theoretical research advanced much in the last few decades
- Theoretical framework for restoration - > *SER Primer on Ecological Restoration* – definitions

## The SER Primer on Ecological Restoration<sup>1</sup>

A Publication of the Science & Policy Working Group<sup>2</sup>  
April 2002 (First Edition)<sup>3</sup>

# THEORY VS. PRACTICE

- Both theoretical ecology and restoration ecology became strong in its playground but rather weak is the communication between the disciplines
- Experiences gained during practical restoration rarely reach theory
- Complicated theories are rarely translated for practitioners

# THEORY VS. PRACTICE

## KEY QUESTIONS

- Q1 How to identify target species and baseline conditions in restoration for the selected habitat?
- Q2 When can one count on spontaneous dispersal and when are additional efforts required for facilitating dispersal of desired species?
- Q3 Which factors determine the successful establishment of target species and assembly of target communities?
- Q4 What time-scale needs to be considered for the evaluation of restoration success and species colonisation?

## TASKS IN HABITAT RESTORATION

### PHASE I – PLANNING

- Receptor site selection (Q1)
- Assessment of initial conditions (Q1)
- Target habitat selection (Q1)
- Method selection (Q2)
- Cost-effectiveness assessment (Q2)

### PHASE II – IMPLEMENTATION

- Site preparation (Q3)
- Implementation of the measure (Q3)
- Short-term management (Q4)

### PHASE III – SUSTAINMENT

- Long-term management (Q4)
- Improvement of habitat quality (Q4)

## RELATED ECOLOGICAL THEORIES

- Habitat specific species pool (Q1)
- Dark diversity (Q1)
- Characteristic and derived diversity (Q1)
- Novel ecosystems and species pools (Q1)
- Species dispersal (Q2)
- Habitat area and connectivity (Q2)
- Compositional heterogeneity (Q2)
- Configurational heterogeneity (Q2)
- Priority effect (Q3)
- Functional diversity (Q3)
- Environmental habitat filtering (Q3)
- Biotic filtering (Q3)
- Extinction debt (Q4)
- Colonisation credit / deficit (Q4)

## Key topics

- ▣ Identification of target vegetation
- ▣ Spontaneous dispersal capacity
- ▣ Establishment limitations
- ▣ Time scale and sustainability

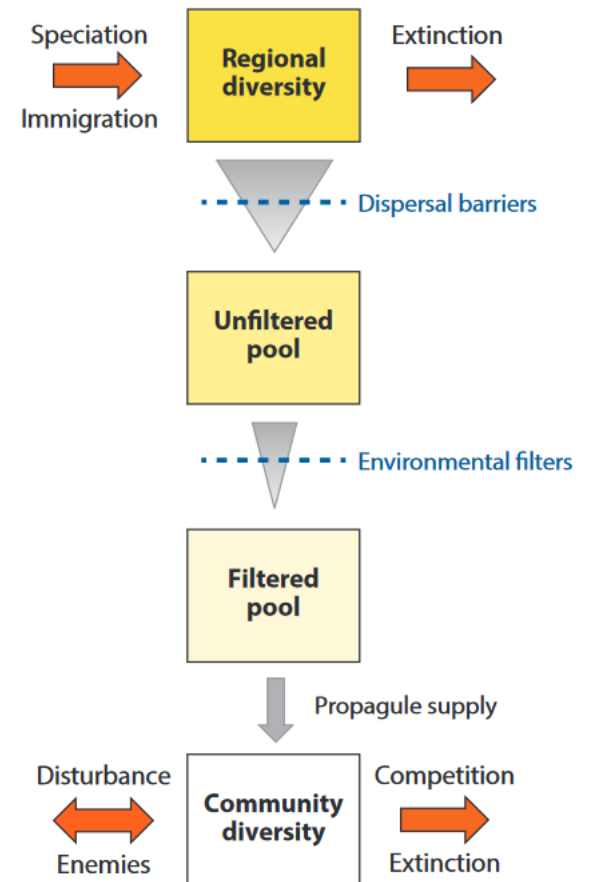

# TARGET COMMUNITY SELECTION

- What is the restoration target?
  - ▣ Self sustaining community with high resistance and resilience to disturbance
  - ▣ Community which can be managed in a sustainable way
- Target to reach a community composition and richness similar to a natural or semi-natural community
- Difficult task to identify the restoration target

# TARGET COMMUNITY SELECTION

- Species pool concept (Zobel et al. 1998)
- Habitat specific species pool (Zobel 2016)
- The size of the species pool is strongly habitat dependent

# TARGET COMMUNITY SELECTION

- Dark diversity – Which species of habitat specific species pool are missing in a respective stand? (Pärtel 2014)
- Which species are, which can spontaneously immigrate into a respective site?
- Community completeness theory

# TARGET COMMUNITY SELECTION

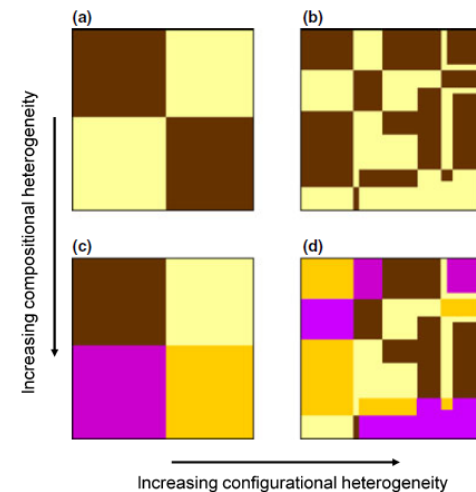

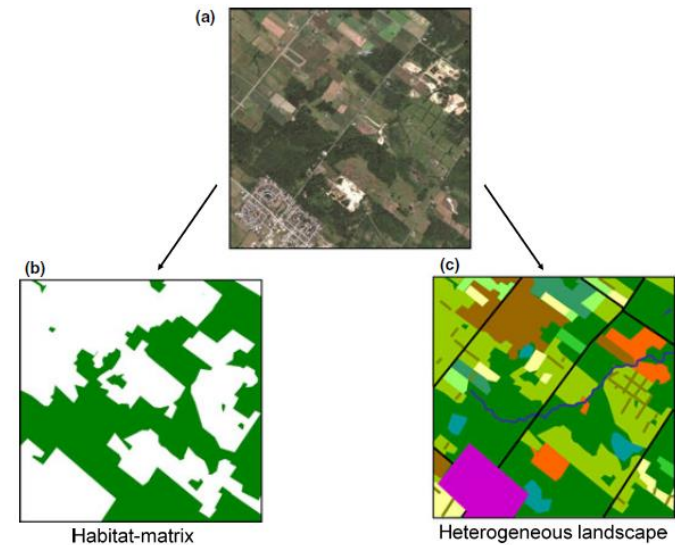

- Realistic restoration target can be set
- Helps in method selection
- Helps to select species which need an active diaspore transfer to restoration site
- Restoration target also changes in time - > Climate change

# SPONTANEOUS DISPERSAL

- Crucial point in restoration the cost-effectiveness
- The propagule providing capacity of the landscape has a crucial role in community conservation and restoration
- The integration of landscape context in the habitat conservation and restoration is relatively novel – Brudvig (2011) Am J. Bot.

# SPONTANEOUS DISPERSAL

- Crucial patterns
    - ▣ Availability and connectivity of target habitats
    - ▣ Landscape-scale habitat complexity
    - ▣ Landscape scale habitat configuration
- Fahrig et al. (2011)

# SPONTANEOUS DISPERSAL

- Differences in specific dispersal capacity - The habitat matrix is not similarly affect species
  - Grassland species dispersal (20- /50/m- 1km)
  - Long distance dispersal
  - Trade-off between dispersal and establishment
  - Role of vectors – i.e. abiotic vs. Biotic dispersal
  - Matrix species – mass effect

# ESTABLISHMENT LIMITATIONS

## □ Factors in establishment

- Site history
- Local abiotic factors
- Site species composition
- Assembly rules
- Priority effect v.s. mass effect)

Environmental filtering

Biotic filtering

## □ Functional diversity and „Trait-based heaven”

## □ Trait-based ecosystem engineering in restoration

# TIME SCALE AND SUSTAINABILITY

- The species composition of target habitats are not in agreement with the current species pool of the landscape
  - ▣ Extinction debt
- Spontaneous colonisation is a slow process
  - ▣ Colonisation credit v agy deficit
- Restoration and fate of established species
- How fast can restored communities reach target?

# OTHER SIDE OF THE COIN

- How can practical conservation and restoration support theory?
- Restoration can be the playground of theory (Restoration is the acid test of ecological theory – Bradshaw 1987)

Török & Helm (2017)  
Biological Conservation

# OTHER SIDE OF THE COIN

- What type of data are available?
  - ▣ Starting conditions
  - ▣ Species transfer rates
  - ▣ Problem species and their dispersal
  - ▣ Conservation and restoration methodology
  - ▣ Conditions at the reference sites
- SER Knowledge Base

# OTHER SIDE OF THE COIN

- In which fields can practical conservation and restoration support theory?
  - ▣ **Temporal changes of communities** (succession theory, state-transitions, convergent or divergent vegetation development, delayed processes)
  - ▣ **Community assembly** (assembly rules, ecosystem stability, functional diversity components, key species, link between structure and function)
  - ▣ **Dispersal dynamics** (spatial dispersal, establishment and seed banks)
  - ▣ **Landscape scale dynamics of biodiversity**

# OTHER SIDE OF THE COIN

- It would be important...
  - ▣ Translate rather complicated theories for conservation and restoration planning and request the help of theoretical ecologists
  - ▣ Summarise the practical needs of conservation and restoration and formulate research questions for targeted theoretical research
